

# Change IP Details Permanent

Feb 2017

## Introduction

To permanently change the IP details you must first be able to connect to the VSPP (see Change IP Address CMD Line). Once connected we need to edit the VSPP Configuration.

The VSPP is configured using a powerful tool called SYSU. SYSU created a file called system.ini that contains all of our configuration parameters.

## Using SYSU

To change the VSPP configuration run the following:

```
sysu edit
```

This will load the system.ini into Vi.

```
<sxh [xml][; options for SyntaxHighlighter]> ##### system Topology ##### ## all parameters marked with green should be changed
with relevant site configuration ## ##### Region and Rack properties ##### [aio-region] type = region inherit = MANAGER:REGION

```

## Change IP Details

There are a few sections we need to change to make IP Address changes that are permanent. The main three sections we are interested in are:

[AIO]  
[MNG]  
[VIDEO]

The IP Address details are split across these three sections.

### [MNG Section]

First check the [MNG] section. <sxh [xml][; options for SyntaxHighlighter]> [MNG] type = network name = management network = 192.168.27.0 netmask = 255.255.255.0 next\_hop = 192.168.27.254 </sxh> Here we specify the network and netmask settings. The main part here is the 'network' section:

```
network = 192.168.27.0
```

This is saying our management address is on the 192.168.27 subnet, the .0 means we are not specifying this octet in this section.

### [VIDEO Section]

Now check the [VIDEO] section. <sxh [xml][; options for SyntaxHighlighter]> [VIDEO] type = network name = video network = 10.10.0.0 netmask = 255.255.0.0 next\_hop = 10.10.255.254 </sxh> Here we are specifying the VIDEO interface subnet, the main part is the network section again.

```
network = 10.10.0.0
```

In this example the VIDEO network is 10.10, the last two octets are specified elsewhere.

### [AIO Section]

Now check the [AIO] section. <sxh [xml][; options for SyntaxHighlighter]> [AIO] type = stateful default\_gateway = MNG os = CENTOS6.6.P30.3-X86\_64 machine = SERVER site = FX-SITE node.aio1 = aio103, MNG-20, VIDEO-20.1 repos = file:/var/sysu/repos/centos6.6, file:/var/sysu/repos/fabrix\_sw apps = syspu, dns, manager, postgres, gui, storage, streamer, graphite, riemann, mon\_agent nic = MNG[ETH2, VIDEO[ETH3 pod = aio-pod </sxh> There are a few configuration items here, but the main points are as follows:

```
node.aio1 = aio103, MNG-20, VIDEO-20.1
```

Here the first part relates the actual VSPP chassis we are on (node.aio1 = aio103) and the next two parts are the final octets of our IP Addresses for Management (MNG) and Video.

```
MNG-20, VIDEO-20.1
```

MNG-20 sets the last octet of our Management address to 20 (so 192.168.27.20)

VIDEO-20.1 sets the last two octets of our VIDEO address to 20.1 (so 10.10.20.1)

## Save and Apply settings

Once you have edited (this is Vi remember) and saved the file, you will need to do the following:

Use **sysu sketch** to load the edited configuration.

```
sysu sketch
```

You will see a lot of text as the unit is configured, keep an eye out for any failures.

Next use **sysu network.config** to apply the network part of the system.ini

```
sysu network.config
```

You can see the available options for sysu by using **sysu tab tab**

<sxh [xml][; options for SyntaxHighlighter]> </sxh>
