

CVQ

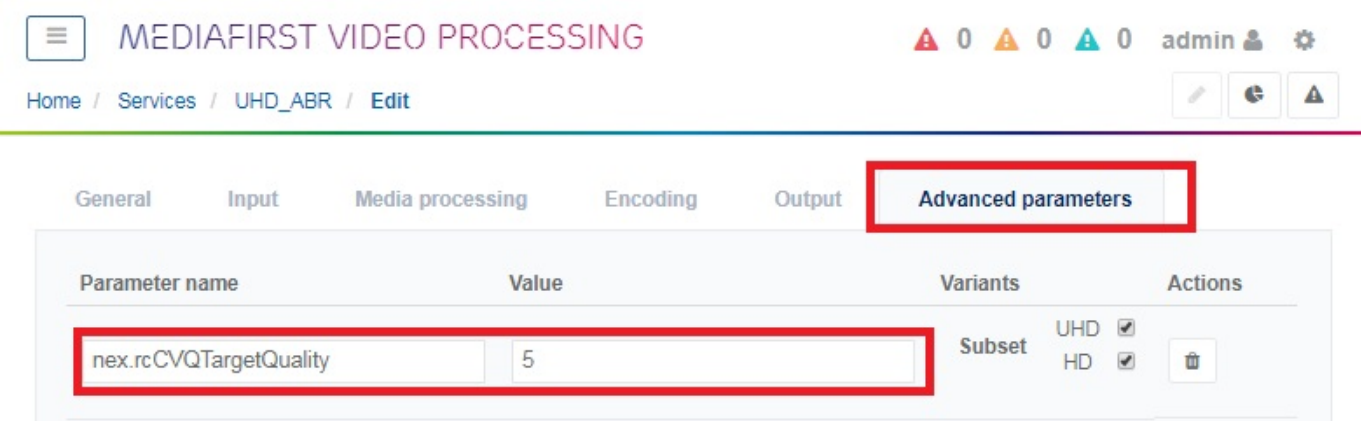

July 2018

CVQ (Contant Video Quality) is a mode available from Encoding Live v10. There are differences between v10 and v10.1 but they try to achieve the same thing, with a different configuration style.

v10

For v10 (and this does work in v10.1 as far as I know) we use an **Advanced Parameter** to configure CVQ.

On the Encoding Configuration page, navigate to the **Advanced Parameters** page (last page currently).

Here we can add the **Advanced Parameter** rcCVQTargetQuality. With this we need to specify a **Value** for this we can use a value of 1-10.

1 - Would be very aggressive, and the PQ would be very low, but the bit rate saving very high. \\
10 - Would be very conservative, PQ would be almost the same as CBR, bit rate saving would be low (unless you get very obvious easy content like black screen or still).\\

v10.1

In 10.1, in the encoding settings page, we can specify a **Target** and **Maximum** bit rate.

Encoding video

Rate control *

VBR (Constant Video Quality)

Target bit rate *

12000

kbps

Maximum bit rate *

18000

kbps

Resolution *

3840

x

2160

3840x2160

Frame rate *

True motion (50/59.94)

Codec *

HEVC Main 10 bits

Video quality mode *

Extreme

Stream conditioning

Blackout
