

Configure Labels

Aug 2017

When creating an EC2 Instance, there are some labels that can be set, these don't seem particularly important, until you have a lot of instances to manage, then you suddenly realise the value of these labels. If you have a lot of EC2 Instances and have not labelled them, you will have a hard time working out which EC2 Instance is performing what task(s).

Below is a single EC2 Instance in AWS, and you can see the two labels that are in the Terraform script.

Name	Instance ID	Instance Type	Availability Zone	Instance State	Status Checks	Alarm Status	Public DNS (IPv4)	IPv4 Public IP	IPv6 IPs	Key Name	Monitoring	Launch Time	Security Groups
ebs-alar-walk	i-0047cd04d583776	t2.micro	eu-west-2a	running	2/2 checks ...	None	ec2-52-56-238-96.eu-w...	52.56.238.96	-	webserver	disabled	July 27, 2017 at 8:36:56 PM	launch-wizard-2

On the left we have 'Name' (click the image to enlarge it) and on the right we have the 'Key Name'. We can see these in the Terraform script.

<sxh text; first-line: 01; highlight: [09:13]; title: New title attribute in action> provider "aws" {

```
access_key = "JLJBK63HMPBC7DC150PA"
secret_key = "K7H2g33xPj6F7zBNcFGTeL5S1bjTsDNA/9nA2caa"
region = "eu-west-2"
```

}

resource "aws_instance" "example" {

```
ami = "ami-40a8bf24"
instance_type = "t2.micro"
key_name = "TestWebSvr"
security_groups = ["launch-wizard-1"]
tags {
  Name = "terraform-instance"
}
```

} </sxh>
