gphoto2 auto detect

Jun 2017

Without any camera connected to the Raspberry Pi, run this command:

```
gphoto2 --auto-detect
```

You should see an output as follows:

```
Model                           Port
----------------------------------------------------------
```

Now connect your camera via USB to your Raspberry Pi, and again run the command:

```
gphoto2 --auto-detect
```

Now if your camera is detected (and I am assuming that means supported) you should see a successful detection. Bear in mind that, after about 2 minutes your camera will auto shut-off, so if you have been reading this page your camera could already be off, just hit the shutter button to wake it up.

```
Model                           Port
----------------------------------------------------------
Canon EOS 700D                  usb:001,005
```

Here we can see that I have connected a Canon EOS 700D, and it is visible on usb:001,005. (the number does seem to change, the second time I tried this on my 700D I got usb:001,007).
